Are you a member of ACCA? Go to the ACCA website to find out about special offers on The ESC Textbook of Intensive and Acute Cardiovascular Care and to buy your copy today. The ESC Textbook of Intensive and Acute Cardiovascular Care is the official textbook of the Acute Cardiovascular Care Association (ACCA) of the ESC. This new updated edition continues to comprehensively approach all the different issues relating to intensive and acute cardiovascular care. The textbook is addressed to all those involved in intensive and acute cardiac care, from cardiologists to emergency physicians and healthcare professionals. The chapters cover the various acute cardiovascular diseases that need high quality intensive treatment, but also organisational issues, cooperation among professionals, and interaction with other specialities in medicine. The largest section of the textbook is devoted to non-cardiac disease which could acutely involve the cardiovascular system. Other noteworthy chapters are on ethical issues - which are so important in acute cardiac care, such as patient safety, donor organ management and palliative care. A unique characteristic of the textbook is the presence of a whole section devoted to biomarkers, which underline the growing importance of laboratory medicine in the field of intensive and acute cardiac care. A particular asset of the textbook is the digital version available on Oxford Medicine Online, which has additional online features including an extra chapter on lung ultrasound and many more images and videos, as well as a full list of references from all chapters. Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the

concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

## **Textbook of Medical Physiology**

Despite an astonishing 100 million-fold range in adult body mass from bumblebee bat to blue whale, all mammals are formed of the same kinds of molecules, cells, tissues and organs and to the same overall body plan. A scaling approach investigates the principles of mammal design by examining the ways in which mammals of diverse size and taxonomy are quantitatively comparable. This book presents an extensive reanalysis of scaling data collected over a quarter of a century, including many rarely or never-cited sources. The result is an unparalleled contribution to understanding scaling in mammals, addressing a uniquely extensive range of mammal attributes and using substantially larger and more rigorously screened samples than in any prior works. An invaluable resource for all those interested in the 'design' of mammals, this is an ideal resource for postgraduates and researchers in a range of fields from comparative physiology to ecology.

## **Prentice Hall Biology**

## **Sturkie's Avian Physiology**

At the 1980 Christmas meetings of the American Society of zoologists in Seattle, Washington, the Division of Comparative Physiology and Biochemistry sponsored a symposium on the locomotion and exercise of arthropods. This book is an outgrowth of that symposium. To our knowledge, the symposium and this volume are the first attempts to deal with all of the major modes of locomotion (flight, swimming, and pedestrian travel) among the arthropods in a comprehensive fashion. The time seems propitious to focus on arthropod locomotion. In the last decade enormous strides have been made in understanding locomotion - both arthropod and vertebrate alike. There has been an explosion of new ideas, new techniques, and new data. These deserve greater attention and discussion than is possible in specialized journals. Hopefully this book will fill this gap; moreover, it should serve as a benchmark for newcomers to see what has happened to date and perhaps act as a launching pad for research to come. Whatever the case, a symposium volume such as this serves to highlight our current strengths and weaknesses. In the present case it reveals the relative abundance of information on flying and walking and the dearth of data available on swimming; it exposes the fact that insects and crustaceans are fairly well studied and arachnids are not.

This text then presents the investigations on the vascular characteristics of the blood supply in bone under variable experimental conditions. Other chapters consider the early descriptions of calcification, its role in osteogenesis, and the belief that calcification is a prerequisite to the laying down of bone. This book discusses as well the vascular anatomy of bone and the development of the nutrient arteries. The final chapter deals with the close origin and independence from the earliest stage of development of vessels and muscles on the one hand and bones and joint on the other. This book is a valuable resource for orthopedic surgeons.

## **Concepts of Biology**

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or  $PO_2$  on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical  $PO_2$ . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.
