Comprehensive Handbook of Psychopathology

This book presents the largest international study of psychological disorders seen in primary health care. Centres in fourteen countries participated in this investigation, including Brazil, Chile, China, India, Nigeria and the USA as well as several European countries. The study has shown how people with mental disorders present their problems to doctors and how likely their disorders are to be detected and treated.

Psychiatry

Treatment of Stress Response Syndromes is the newest work from Mardi J. Horowitz, M.D., the clinical researcher largely responsible for modern concepts of posttraumatic stress disorder (PSTD). In this book, Dr. Horowitz reveals the latest strategies for treating PTSD and expands the coverage to include several related diagnoses. Clinicians who work with patients experiencing the effects of loss, trauma, and terror, will find this handbook to be of great practical value. Readers will learn how to: Diagnose, formulate, and treat stress response syndromes Do a step-by-step formulation, emphasizing strengths as well as problems Use a treatment approach that shifts as the patient changes The author guides the reader through a unique approach to treatment. Rather than organizing the book by individual diagnoses, he integrates essential explanatory principles and techniques -- psychodynamic, cognitive-behavioral, and pharmacological -- into a singular approach to apply to the range of diagnostic entities. With this solid grounding in foundation principles for stress disorders, clinicians will be able to

diagnose and treat patients with individual disorders more effectively. Treatment of Stress Response Syndromes is an invaluable resource for all psychotherapists today. It will give clinicians the knowledge and therapeutic tools they need to help patients develop hope for improvement, courage to face traumatic events, and new knowledge and skills for making adaptive change.

Trauma and Posttraumatic Stress Disorder

Widely regarded as the definitive reference, this handbook brings together foremost authorities on posttraumatic stress disorder (PTSD). Diagnostic, conceptual, and treatment issues are reviewed in depth. The volume examines the causes and mechanisms of PTSD on multiple levels, from psychological processes to genes and neurobiology. Risk and resilience processes are addressed across development and in specific populations. Contributors describe evidence-based assessment and treatment approaches as well as promising emerging interventions. The integrative concluding chapter identifies key unanswered questions with important implications for science and practice. New to This Edition

- *Reflects major research advances and the new diagnostic criteria in DSM-5.
- *Chapters on the dissociative subtype of PTSD, child assessment, couple and family therapies, and group treatments.
- *Chapters on research methods, Internet-based interventions, telemental health, and implementation of best practices.
- *Many new authors and extensively revised chapters.

Treatment of Psychological Distress in Parents of Premature Infants

Anxiety disorders are amongst the most common of all mental health problems. Research in this field has exploded over recent years, yielding a wealth of new information in domains ranging from neurobiology to cultural anthropology to evidence-based treatment of specific disorders. This book offers a variety of perspectives on new developments and important controversies relevant to the theory, research, and clinical treatment of this class of disorders. Clinicians will find reviews of state-of-the-art treatments for panic disorder, social anxiety disorder, phobias, obsessive-compulsive disorder, generalized anxiety disorder, and post-traumatic stress disorder, as well as controversies over diagnostic and treatment issues. Researchers will find in-depth consideration of important selected topics, including genetics, neuroimaging, animal models, contemporary psychoanalytic theory, and the impact of stressors. This book illustrates the enormous advances that have occurred in anxiety research and describes the evolving multi-disciplinary efforts that will shape the future of the field.

Measurement of Stress, Trauma, and Adaptation

First published in 1990. Routledge is an imprint of Taylor & Francis, an informa company.

Posttraumatic and Acute Stress Disorders

This book offers an evidence based guide for clinical psychologists, psychiatrists,

psychotherapists and other clinicians working with trauma survivors in various settings. It provides easily digestible, up-to-date information on the basic principles of traumatic stress research and practice, including psychological and sociological theories as well as epidemiological, psychopathological, and neurobiological findings. However, as therapists are primarily interested in how to best treat their traumatized patients, the core focus of the book is on evidence based psychological treatments for trauma-related mental disorders. Importantly, the full range of trauma and stress related disorders is covered, including Acute Stress Reaction, Complex PTSD and Prolonged Grief Disorder, reflecting important anticipated developments in diagnostic classification. Each of the treatment chapters begins with a short summary of the theoretical underpinnings of the approach, presents a case illustrating the treatment protocol, addresses special challenges typically encountered in implementing this treatment, and ends with an overview of related outcomes and other research findings. Additional chapters are devoted to the treatment of comorbidities, special populations and special treatment modalities and to pharmacological treatments for trauma-related disorders. The book concludes by addressing the fundamental question of how to treat whom, and when.

User's Guide for the Structured Clinical Interview for DSM-III-R

Treatment of Stress Response Syndromes

This comprehensive, authoritative volume meets a key need for anyone providing treatment services or conducting research in the area of trauma and PTSD, including psychiatrists, clinical psychologists, clinical social workers, and students in these fields. It is an invaluable text for courses in stress and trauma, abuse and victimization, or abnormal psychology, as well as clinical psychology practica.

Tolme Tales

There are a number of books recently published on assessment scales for depression and anxiety. However, these books are generally more detailed than clinicians require, are specific to one or other condition, or involve specialty populations such as children or geriatrics. To meet the needs of clinicians treating patients with depressive and anxiety disorders, this volume aims to bring together empirically validated assessment scales. In a concise and user-friendly format, *Assessment Scales in Depression and Anxiety* illustrates the assessment scales used in clinical trials and research studies; shows how to select an assessment scale and to decide which scale to use for a particular clinical situation; and provides sample assessment scales for clinicians to use in their practice.

Practitioner's Guide to Empirically Based Measures of Anxiety

Mental disorders, including posttraumatic stress disorder (PTSD), constitute an important health care need of veterans, especially those recently separated from service. *Treatment of Posttraumatic Stress Disorder: An Assessment of the Evidence* takes a systematic look the efficacy of pharmacologic and psychological

treatment modalities for PTSD on behalf of the Department of Veterans Affairs. By reviewing existing studies in order to draw conclusions about the strength of evidence on several types of treatment, the Committee on the Treatment of Posttraumatic Stress Disorder found that many of these studies were faulty in design and performance, and that relatively few of these studies have been conducted in populations of veterans, despite suggestions that civilian and veteran populations respond differently to various types of treatment. The committee also notes that the evidence is scarce on the acceptability, efficacy, or generalizability of treatment in ethnic and cultural minorities, as few studies stratified results by ethnic background. Despite challenges in the consistency, quality, and depth of research, the committee found the evidence sufficient to conclude the efficacy of exposure therapies in treating PTSD. The committee found the evidence inadequate to determine efficacy of different types of pharmacotherapies, of three different psychotherapy modalities, and of psychotherapy delivered in group formats. The committee also made eight critical recommendations, some in response to the VA's questions related to recovery and the length and timing of PTSD treatment, and others addressing research methodology, gaps in evidence and funding issues.

Embitterment

This book has been replaced by *Effective Treatments for PTSD, Third Edition*, edited by David Forbes, Jonathan I. Bisson, Candice M. Monson, and Lucy Berliner, ISBN 978-1-4625-4356-4.

A Fresh Look at Anxiety Disorders

Embitterment is a distinct state of mood known to everyone. It can be seen in the context of exceptional though "normal" negative life events. It is an emotional reaction e.g. to humiliation, to being severely disappointed by others, or to violations of basic values. Embitterment is accompanied by other emotions like feelings of hopelessness and helplessness, poor moods and a lack of drive, and aggression towards oneself and others. It can end in suicide or even murder-suicide and in a distinct pathological state known as "Posttraumatic Embitterment Disorder (PTED)". But despite the high prevalence rates, the detrimental effects on individuals and its forensic and societal importance, embitterment has yet to receive due scientific attention. In this book pioneers in embitterment research summarize the current knowledge on embitterment, its triggers, phenomenology and consequences. The work is intended to stimulate international debate and to contribute to a better understanding of embitterment and a deeper appreciation of the impact of exceptional but normal negative life events on psychological well-being.

PTSD Compensation and Military Service

The Workshop on Integrating New Measures of Trauma into the Substance Abuse and Mental Health Services Administration's (SAMHSA) Data Collection Programs, held in Washington, D.C. in December 2015, was organized as part of an effort to assist SAMHSA and the Office of the Assistant Secretary for Planning and

Evaluation of the U.S. Department of Health and Human Services in their responsibilities to expand the collection of behavioral health data to include measures of trauma. The main goals of the workshop were to discuss options for collecting data and producing estimates on exposure to traumatic events and PTSD, including available measures and associated possible data collection mechanisms. This report summarizes the presentations and discussions from the workshop.

Posttraumatic Stress Disorder

A handy, easy-to-read reference for the diagnosis and treatment of posttraumatic and acute stress disorders, this important 6th edition has been revised and updated extensively, offering a wealth of new information in a concise format of 6 sections. The new DSM-5 diagnostic criteria for PTSD and Acute Stress Disorder (ASD) are discussed, in depth, in Chapters 2 and 6, respectively. In addition, updated tables listing instruments for assessing diagnosis and symptom severity are cited and annotated in seven appendices, as in previous editions. Chapters 3-5 have been revised to keep pace with the ever-expanding literature on treatment of PTSD. This is especially true in Chapter 4 where, in addition to a focus on evidence-based cognitive-behavioral therapy, CBT and other individual psychosocial treatments (e.g. eye movement desensitization and reprocessing, EMDR), the growing literature is presented on couples, family, group and school-based treatments for adults, children and adolescents. Chapter 5 reviews the pathophysiology of PTSD and evidence-based pharmacotherapy for the disorder. Chapter 6 addresses both normal acute stress reactions and clinically significant ASD, as well as effective interventions for each. A comprehensive, sophisticated, practical reference for all clinicians, *Posttraumatic and Acute Stress Disorders, 6th Edition* is an invaluable resource designed to guide the best clinical attention for individuals suffering from posttraumatic and acute stress disorders.

Davidson Trauma Scale (DTS)

These WHO mhGAP guidelines were developed to provide recommended management strategies for conditions specifically related to stress, including symptoms of acute stress, post-traumatic stress disorder and bereavement. The guidelines were developed by an independent Guidelines Development Group and inform a new mhGAP module on the Assessment and Management of Conditions Specifically Related to Stress.

Guidelines for the Management of Conditions Specifically Related to Stress

Published on Behalf of the World Health Organization

Psychological Assessment of Veterans

This book, the ideal following of the previous *New Insights into Anxiety Disorders*, collects papers of a number of clinical psychiatrists all over the world, giving their contribution to the comprehension and clinical management of anxiety disorders.

Following the previously edited book on anxiety, this new one will focus on some specific clinical issues such as PTSD, psychosomatics, and complementary approaches to anxiety management themes which were not discussed in the previous book.

Evidence Based Treatments for Trauma-Related Psychological Disorders

Post traumatic stress disorder (PTSD) is a common and disabling condition that often goes undiagnosed. This book outlines state of the art approaches to improving the diagnosis and treatment of PTSD, with a particular emphasis on the promise and pitfalls associated with virtual reality (VR) exposure therapy.

Novel Approaches to the Diagnosis and Treatment of Posttraumatic Stress Disorder

The scars of war take many forms: the limb lost, the illness brought on by a battlefield exposure, and, for some, the psychological toll of encountering an extremely traumatic event. PTSD Compensation and Military Service presents a thorough assessment of how the U.S. Department of Veterans Affairs evaluates veterans with possible posttraumatic stress disorder and determines the level of disability support to which they are entitled. The book presents a history of mental health disability compensation of military personnel and reviews the current compensation and pension examination procedure and disability determination methodology. It offers a number of recommendations for changes that would improve the fairness, consistency, and scientific foundation of this vital program. This book will be of interest and importance to policy makers, veterans affairs groups, the armed forces, health care organizations, and veterans themselves.

Effective Treatments for PTSD, Second Edition

This volume delves into recent findings on the psychological effects of premature birth on parents. Individual chapters focus on maternal psychological distress as well as the commonly neglected issues that affect fathers. Uniquely, this book outlines a comprehensive programmatic approach to psychological consultation in the neonatal intensive care unit (NICU), describing how to leverage common interventions, including trauma-focused cognitive-behavioral therapy, in innovative ways to reduce symptoms of anxiety, depression, and PTSD.

Mental Illness in General Health Care

This book is a comprehensive analysis of the definitions, concepts, and recent research on malingering, feigning, and other response biases in psychological injury/ forensic disability populations. It presents a new model of malingering and related biases, and develops a “diagnostic” system based on it that is applicable to PTSD, chronic pain, and TBI. Included are suggestions for effective practice and future research based on the literature reviews and the new systems, which are useful also because they can be used readily by psychiatrists as much as psychologists. In Malingering, Feigning, and Response Style Assessment in

Psychiatric/Psychological Injury, Dr. Young ambitiously sets out to articulate and synthesize the polarities involved in the assessment of response styles in psychological disabilities, including PTSD, pain, and TBI. He does so thoroughly and very even-handedly, neither minimizing the degree that outright faking can be found in substantial numbers of examinees, nor disregarding the possibility that there can be causes for validity test failure other than malingering. He reviews the prior systems for classifying evidence of malingering, and proposes his own criteria for feigned PTSD. These are conservative and well-grounded in the prior literature. Finally, the book contains dozens of very recent references, giving testament to Dr. Young's immersion in the personal injury literature, as might be expected from his experience as founder and Editor in Chief for Psychological Injury and the Law. Reviewer: Steve Rubenzer, Ph.D., ABPP Board Certified Forensic Psychologist

Rating Scales in Mental Health

This volume provides a single resource that contains information on almost all of the measures that have demonstrated usefulness in measuring the presence and severity of anxiety and related disorders. It includes reviews of more than 200 instruments for measuring anxiety-related constructs in adults. These measures are summarized in 'quick view grids' which clinicians will find invaluable. Seventy-five of the most popular instruments are reprinted and a glossary of frequently used terms is provided.

Post-traumatic Stress Disorder

This book presents the author's ancestry through the Tolme line. It describes in four parts the history of the Tolme line back to the 1550s in Scotland, then the lines of descent to Charles David Tolme (1792-1872), who served as British Consul in Cuba. Part 3 describes Tolme's nine children and their descendants, followed lastly by part 4, which describes the author's descent from Tolme's youngest child, Emily (1841-1893). There are many interesting stories and condensed biographies of family members in Germany, England, France and the USA. Relatives have made their mark in business, diplomacy, physics, radar development, astronomy, mathematics, arts patronage, writing, building construction, to name a few examples.

Assessment Scales in Depression and Anxiety - CORPORATE

Psychological assessment is practiced in wide-ranging settings to address the varied clinical and administrative needs of veteran populations. Such assessment blends record review, clinical interviews of the veteran and collateral sources of information, behavioral observations, and psychological testing. This book promotes the care and well-being of veterans by bringing together knowledgeable and experienced psychologists to discuss a range of psychological assessment methods and procedures. It aims to help patients and their families, healthcare providers, and concerned citizens gain an improved understanding of veterans' cognitive functioning, emotional states, personality traits, behavioral patterns, and daily functioning. The book begins with a history of the psychological assessment of veterans and investigates its efficacy in different settings, including outpatient

mental health, long-term care, primary care, home-based primary care, and telemental health. Later chapters address assessment of a variety of disorders or presenting problems, including substance use disorders, psychotic disorders, mood disorders and suicidal thoughts and behavior, PTSD and other anxiety disorders, attention-deficit/hyperactivity disorder, dementia, pain and pain-related disorders, and polytrauma. The book concludes with important special considerations, including assessment of symptom and performance validity, assessment of homeless veterans and health-related quality of life, and ethical, legal, and professional issues. *Psychological Assessment of Veterans* provides an essential reference and guide for clinical psychologists, including those working in the subspecialties, and psychology trainees who work with veterans.

Cultural Psychiatry

Now in a new Fourth Edition, *Psychiatry* remains the leading reference on all aspects of the current practice and latest developments in psychiatry. From an international team of recognised expert editors and contributors, *Psychiatry* provides a truly comprehensive overview of the entire field of psychiatry in 132 chapters across two volumes. It includes two new sections, on psychosomatic medicine and collaborative care, and on emergency psychiatry, and compares Diagnostic and Statistical Manual (DSM-5) and International Classification of Diseases (ICD10) classifications for every psychiatric disorder. *Psychiatry, Fourth Edition* is an essential reference for psychiatrists in clinical practice and clinical research, residents in training, and for all those involved in the treatment of psychiatric disorders. Includes a companion website at www.tasmanpsychiatry.com featuring PDFs of each chapter and downloadable images

Treatment of Posttraumatic Stress Disorder

This work is a vital set of insights and guidelines that will contribute to more aware and meaningful practice for mental health professionals. Focusing equally on theoretical concepts, culturally valid assessment methods, and cultural adaptation in trauma and resilience, an array of experts present the cutting edge of research and strategies. Extended case studies illustrate an informative range of symptom profiles, comorbid conditions, and coping skills, as well as secondary traumas that can occur in asylum seekers.

Measuring Trauma

Cultural psychiatry has been the portal through which advances in the social sciences have found their way into medical practice and health policy. Diverse issues and activities in research and practice of cultural and transcultural psychiatry are collected in this timely volume. The contributions can be summarized in three main topics: interdisciplinary settings for practice and research; migration, trauma and the context of migrant mental health, and cultural lessons for treatment. This book provides essential reading for health professionals and social scientists who would like to understand how culture influences mental health as well as the treatment and prevention of mental illness. It will be of

special interest to medical anthropologists concerned with the relationship between culture theory and psychiatry, mental health care providers and policy makers in an international environment.

Assessment of Depression

Of all psychiatric disorders, posttraumatic stress disorder (PTSD) poses one of the greatest challenges to clinicians. Drs. Davidson and Foa, pioneers in the study of PTSD, have teamed up to edit this landmark volume. In *Posttraumatic Stress Disorder: DSM-IV® and Beyond*, members of the DSM-IV Subcommittee on PTSD present a comprehensive and fascinating review of the currently established knowledge about the etiology, epidemiology, neurobiology, course, and clinical presentations of posttraumatic stress syndromes and future directions for study.

The Cambridge Handbook of Clinical Assessment and Diagnosis

This Handbook provides a contemporary and research-informed review of the topics essential to clinical psychological assessment and diagnosis. It outlines assessment issues that cross all methods, settings, and disorders, including (but not limited to) psychometric issues, diversity factors, ethical dilemmas, validity of patient presentation, psychological assessment in treatment, and report writing. These themes run throughout the volume as leading researchers summarize the empirical findings and technological advances in their area. With each chapter written by major experts in their respective fields, the text gives interpretive and practical guidance for using psychological measures for assessment and diagnosis.

Assessing Psychological Trauma and PTSD

Posttraumatic stress disorder (PTSD) is a prevalent, debilitating public health problem. Cognitive behavioral therapies (CBTs), and specifically exposure-based therapy, have long dominated PTSD treatment. Empirically supported treatments- Prolonged Exposure (PE), Cognitive Processing Therapy, Eye Movement Desensitization and Reprocessing (EMDR), and virtual reality therapy-all have relied upon the "fear extinction model" of exposing patients to reminders of their trauma until they grow accustomed to and extinguish the fear. While exposure-based treatments work, they (like all treatments) have their limits. Many patients refuse to undergo them or drop out of treatment prematurely; others may actually worsen in such treatment; and still others simply do not benefit from them. Interpersonal Psychotherapy for Posttraumatic Stress Disorder describes a novel approach that has the potential to transform the psychological treatment of PTSD. Drawing on exciting new clinical research findings, this book provides a new, less threatening treatment option for the many patients and therapists who find exposure-based treatments grueling. Interpersonal Psychotherapy (IPT) for PTSD was tested in a randomized controlled trial that compared three psychotherapies. Dr. Markowitz and his group found that IPT was essentially just as effective as exposure-based Prolonged Exposure. IPT had higher response rates and lower dropout rates than did PE, particularly for patients who were also suffering from major depression. These novel findings suggest that patients need not undergo exposure to recover from PTSD. Interpersonal Psychotherapy for Posttraumatic

Stress Disorder describes an exciting alternative therapy for PTSD, details the results of the study, and provides an IPT treatment manual for PTSD.

Posttraumatic Stress Disorder

This book is intended for clinicians at all levels of experience who seek a guide to the assessment of psychological trauma and its effects. After discussion of the theoretical foundation for understanding human responses to traumatic events, Dr. Carlson addresses both conceptual and practical aspects of selecting and administering measures to assess traumatic experiences and trauma responses. Additional chapters provide guidance in interpreting results of assessments and diagnosing trauma-related disorders and a brief introduction to major forms of treatment of trauma-related disorders. Profiles of 36 recommended measures of traumatic experiences and trauma responses are included and are designed to make it easy to find the information needed to obtain the measures. Measures profiled include self-report and interview measures of trauma, self-report measures of trauma responses, structured interviews for posttraumatic and dissociative disorders, and measures for children and adolescents. Flowcharts provide a quick reference for choosing measures at each stage of the assessment process.

Malingering, Feigning, and Response Bias in Psychiatric/ Psychological Injury

Rating Scales in Mental Health is ideal for mental health clinicians and researchers who use psychometric instruments in their practice. The updated edition of this highly regarded compendium describes and analyzes 116 scales arranged in 20 categories, including anxiety, bipolar disorder, depression, eating disorders, geriatrics, psychosis, sexual disorders, substance abuse, and suicide risk. Material on each rating scale consists of • an overview • general applications • selected psychometric properties • references and copyright information • time needed to complete scale • a representative study Samples of many scales are included, as are tables in a quick-reference format.

Handbook of PTSD, Second Edition

Current research and clinical observations suggest pronounced gender-based differences in the ways people respond to traumatic events. Most notably, women evidence twice the rate of PTSD as men following traumatic exposure. This important volume brings together leading clinical scientists to analyze the current state of knowledge on gender and PTSD. Cogent findings are presented on gender-based differences and influences in such areas as trauma exposure, risk factors, cognitive and physiological processes, comorbidity, and treatment response. Going beyond simply cataloging gender-related data, the book explores how the research can guide us in developing more effective clinical services for both women and men. Incorporating cognitive, biological, physiological, and sociocultural perspectives, this is an essential sourcebook and text.

Cross-Cultural Assessment of Psychological Trauma and PTSD

The first systematic analysis of the rates, risk factors, consequences and global burden of trauma and PTSD across the globe.

Interpersonal Psychotherapy for Posttraumatic Stress Disorder

Trauma And The Vietnam War Generation

In response to growing national concern about the number of veterans who might be at risk for posttraumatic stress disorder (PTSD) as a result of their military service, the Department of Veterans Affairs (VA) asked the Institute of Medicine (IOM) to conduct a study on the diagnosis and assessment of, and treatment and compensation for PTSD. An existing IOM committee, the Committee on Gulf War and Health: Physiologic, Psychologic and Psychosocial Effects of Deployment-Related Stress, was asked to conduct the diagnosis, assessment, and treatment aspects of the study because its expertise was well-suited to the task. The committee was specifically tasked to review the scientific and medical literature related to the diagnosis and assessment of PTSD, and to review PTSD treatments (including psychotherapy and pharmacotherapy) and their efficacy. In addition, the committee was given a series of specific questions from VA regarding diagnosis, assessment, treatment, and compensation. Posttraumatic Stress Disorder is a brief elaboration of the committee's responses to VA's questions, not a detailed discussion of the procedures and tools that might be used in the diagnosis and assessment of PTSD. The committee decided to approach its task by separating diagnosis and assessment from treatment and preparing two reports. This first report focuses on diagnosis and assessment of PTSD. Given VA's request for the report to be completed within 6 months, the committee elected to rely primarily on reviews and other well-documented sources. A second report of this committee will focus on treatment for PTSD; it will be issued in December 2006. A separate committee, the Committee on Veterans' Compensation for Post Traumatic Stress Disorder, has been established to conduct the compensation study; its report is expected to be issued in December 2006.

Trauma Assessments

This evidence-based clinical guideline commissioned by NICE (National Institute for Clinical Excellence) presents guidance on the management of post-traumatic stress disorder (PTSD) in primary and secondary care.

Anxiety Disorders

The purpose of this handbook, originally published in 1984, was to provide a comprehensive review of current clinical descriptions, research, and theories of psychopathology. Descriptive psychopathology is a field that forms the foundation of clinical practice and research in clinical psychology, psychiatry, psychiatric social work, psychiatric nursing, and allied professions in mental health. Since the 1st edition, the editors have devised and updated a handbook to cover both general and specific topics in psychopathology that would be useful to researchers, practitioners, and graduate or other advanced students in the mental health and

behavioral medicine professions. To implement this plan, we have very carefully chosen colleagues whom we respect for their expertise in particular fields. These authors include both clinicians and researchers who have outstanding national reputations, as well as more junior behavioral scientists and clinicians who, in our opinion, will achieve similar recognition in the future. The excellent chapters in this book lead us to believe that we have chosen wisely. We would like to express our appreciation to these authors for their outstanding contributions and cooperation.

Gender and PTSD

Invisible Wounds of War

A comprehensive study of the post-deployment health-related needs associated with post-traumatic stress disorder, major depression, and traumatic brain injury among servicemembers returning from Operations Enduring Freedom and Iraqi Freedom, the health care system in place to meet those needs, gaps in the care system, and the costs associated with these conditions and with providing quality health care to all those in need.
