Elevate Science

The search for our elusive human origins and an understanding of the mysteries of the human body have challenged the most inquisitive and imaginative thinkers from Egyptian times through the twentieth century. In *The Epic History of Biology*, Anthony Serafini - a distinguished philosopher and historian of science - regales the reader with the triumphs and failures of the geniuses of the life sciences. The subtleties of the animal kingdom - anatomy, zoology, and reproduction - along with the complexities of the plant kingdom, have fascinated humanity as far back as 5000 years ago. Astounding ancient knowledge of the arcane curing powers of herbs as well as early experimentation with different chemical combinations for such purposes as mummification led to today's biological technology. Innovative

pioneers such as Aristotle, Galen, Hippocrates, and Vesalius challenged the limits of knowledge and single-mindedly pursued their work, often in the face of blind superstition. In superb, lyrical prose Serafini recreates the ideas and theories of these revolutionaries from ancient times through today, against the backdrop of the dogma and prejudices of their time. He explores the inspired revelations that gave birth to such discoveries as the controversial theory of evolution, the humble origins of genetics, the fantastic predictions of quantum mechanics, and the infinite promise of computer technology. Even today the biological sciences are undergoing rapid and kaleidoscopic changes. Every new insight gives rise to a myriad of new ethical questions and responsibilities. The Epic History of Biology confronts these issues head on and predicts the wondrous new directions biology will follow.

So what's so special about doctors and their families? Many doctors feel that they are expected to give too much of their time to a medical career to the detriment of their family and their personal lives. This book is a practical guide to provide support and ideas on how to cope with stresses directly suffered or passed on from a relative or spouse. Written in a clear and practical style using information collated from family members describing their feelings about having a doctor in the family it provides unique and vital information on how to minimise the effects of having a medical career on the family. Essential reading for doctors and their families.

Key features: Captures the historic context and recent developments in science and policy arenas that address the potential for coastal wetlands to be considered

as significant contributors to carbon sequestration Links multiple levels of science (biogeochemistry, geomorphology, paleoclimate, etc.) with blue carbon concepts (science, policy, mapping, operationalization, economics) in a single compendium Concludes with a discussion of future directions which covers integrated scientific approaches, impending threats and specific gaps in current knowledge Includes 7 case studies from across the globe that demonstrate the benefits and challenges of blue carbon accounting Written by over 100 leading global blue carbon experts in science and policy. Blue Carbon has emerged as a term that represents the distinctive carbon stocks and fluxes into or out of coastal wetlands such as marshes, mangroves, and seagrasses. The Blue Carbon concept has rapidly developed in science literature and is highly relevant politically, as nations and markets are developing blue carbon monitoring and management tools and policies. This book is a comprehensive and current compendium of the state of the science, the state of maps and mapping protocols, and the state of policy incentives (including economic valuation of blue carbon), with additional sections on operationalizing blue carbon projects and 7 case studies with global relevance.

Satellite remote sensing presents an amazing opportunity to inform biodiversity conservation by inexpensively gathering repeated monitoring information for vast areas of the Earth. However, these observations first need processing and interpretation if they are to inform conservation action. Through a series of case studies, this book presents detailed examples of the application of satellite remote sensing, covering both aquatic and terrestrial ecosystems, to conservation. The authors describe how collaboration between the remote sensing and conservation communities makes satellite data functional for operational conservation, and provide concrete examples of the lessons learned in addition to the scientific details. The editors, one at NASA and the other at a conservation NGO, have brought together leading researchers in conservation remote sensing to share their experiences from project development through to application, and emphasise the human side of these projects.

E3 Chemistry Guided Study Book - 2018 Home Edition (Answer Key Included)

In just a half century, humanity has made an astounding leap in its understanding of life. Now, one of the giants of biological science, Christian de Duve, discusses what we've learned in this half century, ranging from the tiniest cells to the future of our species and of life itself. With wide-ranging erudition, De Duve takes us on a dazzling tour of the biological world, beginning with the invisible workings of the cell, the area in which he won his Nobel Prize. He describes how the first cells may have arisen and suggests that they may have been like the organisms that exist today near deep-sea hydrothermal vents. Contrary to many scientists, he argues that life was bound to arise and that it probably only took millennia--maybe tens of thousands of years--to move from rough building blocks to the first organisms possessing the basic properties of life. With equal authority, De Duve examines topics such as the evolution of humans, the origins of consciousness, the development of language, the birth of science, and the origin of emotion, morality, altruism, and love. He concludes with his conjectures on the future of humanity--for instance, we may evolve, perhaps via genetic engineering, into a new species--and he shares his personal thoughts about God and immortality. In *Life Evolving*, one of our most eminent scientists sums up what he has learned about the nature of life and our place in the universe. An extraordinarily wise and humane volume, it will fascinate readers curious about the world around them and about the impact of science on philosophy and religion.

Auténtico

Rivers are the great shapers of terrestrial landscapes. Very few points on Earth above sea level do not lie within a drainage basin. Even points distant from the nearest channel are likely to be influenced by that channel. Tectonic uplift raises rock thousands of meters above sea level. Precipitation falling on the uplifted terrain concentrates into channels that carry sediment downward to the oceans and influence the steepness of adjacent hill slopes by governing the rate at which the landscape incises. Rivers migrate laterally across lowlands, creating a complex topography of terraces, floodplain wetlands and channels. Subtle differences in elevation, grain size, and soil moisture across this topography control the movement of ground water and the distribution of plants and animals. Rivers in the Landscape, Second Edition, emphasizes general principles and conceptual models, as well as concrete examples of each topic drawn from the extensive literature on river process and form. The book is suitable for use as a course text or a general reference on rivers. Aimed at advanced undergraduate students, graduate students, and professionals looking for a concise summary of physical aspects of rivers, Rivers in the Landscape is designed to: emphasize the connectivity between rivers and the greater landscape by explicitly considering the interactions between rivers and tectonics, climate, biota, and human activities; provide a concise summary of the current state of knowledge for physical process and form in rivers; reflect the diversity of river environments, from mountainous, headwater channels

to large, lowland, floodplain rivers and from the arctic to the tropics; reflect the diverse methods that scientists use to characterize and understand river process and form, including remote sensing, field measurements, physical experiments, and numerical simulations; reflect the increasing emphasis on quantification in fluvial geomorphology and the study of Earth surfaces in general; provide both an introduction to the classic, foundational papers on each topic, and a guide to the latest, particularly insightful and integrative references.

Mike Peng and Klaus Meyer have direct, first-hand, experience of researching and teaching in Europe, Asia and North America. This combined experience makes them uniquely qualified to write this textbook, which offers a comprehensive and accessible introduction to international business that starts from Europe but ultimately encompasses the globe. The text's comprehensive coverage is accessibly arranged around one central question and two core perspectives. The central question is what determines the success and failure of firms around the globe? Institutional and resource-based perspectives are utilised to answer this question. Throughout the text the very latest scholarly research is used to facilitate successful learning of the key concepts, in order to engage students with the historical context and recent global developments. International Business has been shortlisted for the 2011/12 CMI Management Book of the Year award in the ebook category. More information about the CMI and the competition can be found here <http://yearbook.managers.org.uk/index5.htm>.

Chemistry 2012 Student Edition (Hard Cover) Grade 11

“We share a common bond with even the most bizarre beetle of the Peruvian rain forest,” asserts John Janovy Jr. “A belief in that common bond might, in fact, be the most fundamental characteristic of a biologist.” And biologists see the worth of a plant or an animal not in monetary terms but in its contribution to our understanding of life. The famous naturalist brings a humanist’s vision to this superbly written book. *Becoming a Biologist* is grounded in reality, cognizant of practical matters (education and jobs) as well as the ideals that inform the profession—a reverence for life and a responsibility to humankind and its future. Janovy draws on his experiences as a graduate and postdoctoral student, on his rewarding relationships with teachers, and on his fieldwork as a naturalist. This edition includes new information throughout the book regarding pertinent events, issues, and changes in technology.

This fascinating exploration of Venezuelan Informalism charts the movement's history from its beginnings in the mid-1950s to its last manifestations in the 1970s. Essays by an esteemed group of scholars discuss the variety, richness, and complexity of Informalism and examine the ways in which Venezuelan artists embraced many of the abstract, gestural tendencies contemporaneously developed in Abstract Expressionism, Tachism, and Art Informel. Providing a thorough and comprehensive overview of this artistically fertile, yet underappreciated, movement, this volume highlights the diverse approaches and the wide range of media employed by Informalism's key practitioners, including Elsa Gramcko, Alberto Brandt, Francisco Hung, Daniel González, and the collective El Techo de la Ballena. Also featured are stunning works by internationally acclaimed figures who experimented with Informalism, such as Alejandro Otero, Carlos Cruz-Diez, and Jesús Rafael Soto.

For several years, researchers have been reporting the effects of microwave radiation/heating on both the structure and function of DNA, RNA and proteins. For the most part, favourable accelerated biological functions are observed as microwave induced heating occurs, but other not-so favourable effects are also observed, such as denaturation, fragmentation and the so called and ill-explained, non-thermal microwave effects. This volume, the first of its kind, brings researchers together from around the world to discuss their current findings and thinking on the effects of Microwaves on Biological systems, particularly DNA, RNA and proteins, in the form of contributed edited chapters.

Molecular Biology: Principles of Genome Function offers a fresh, distinctive approach to the teaching of molecular biology. With its focus on key principles, its emphasis on the commonalities that exist between the three kingdoms of life, and

its integrated approach throughout, it is the perfect companion to any molecular biology course.

Life Evolving

Focuses on organisational goals and those of other stakeholders and society at large. This book provides an insight into the potential benefits and pitfalls, expectations and concerns of advancing a critical view of HRD in practice. It is intended for lecturers, students and practitioners who are aching for a critical analysis.

Advances in Construction Materials 2007

This book considers all aspects of bioprospecting in 14 succinct chapters and a forward by David Hawksworth. The organisms addressed include plants, insects, fungi, bacteria and phages. Bioprospecting has never been more relevant and is of renewed interest, because of the extremely worrying rise in novel, resistant pathogenic microorganisms. The practices in pharmaceutical companies have failed to deliver novel antibiotics to control these infections. We need to look for new sources of drugs from the environment on a massive scale as drug discovery is “too important to fail”. Furthermore, the field can add great value to ecosystems

in terms of economics, while providing additional reasons for maintaining associated services, such as food provision, benign climate, effective nutrient cycling and cultural practices. Bioprospecting provides another reason why climate change must be reduced in order to preserve relevant environments. Previous bioprospecting projects should be re-visited and established biodiversity centres have a major role. Many different ecosystems exist which contain unique organisms with the potential to supply novel antibiotics, enzymes, food, and cosmetics, or they may simply have aesthetic value. The book stresses the difficulties in obtaining successful products and yet describes why natural products should be investigated over combinatorial chemistry. Personal experience of bioprospecting projects are given significance. Issues such as how to share the benefits equitably with local communities are described and why pharmaceutical companies can be reluctant to be involved. Legal issues are discussed. Finally, there has never been a better time for a new book on bioprospecting, because of the need to preserve ecosystems, and from the emergence of resistant pathogenic microorganisms.

The Epic History of Biology

In a world of increasing atmospheric CO₂, there is intensified interest in the ecophysiology of photosynthesis and increasing attention is being given to carbon exchange and storage in natural ecosystems. We need to know how much

photosynthesis of terrestrial and aquatic vegetation will change as global CO₂ increases. Are there major ecosystems, such as the boreal forests, which may become important sinks of CO₂ and slow down the effects of anthropogenic CO₂ emissions on climate? Will the composition of the vegetation change as a result of CO₂ increase? This volume reviews the progress which has been made in understanding photosynthesis in the past few decades at several levels of integration from the molecular level to canopy, ecosystem and global scales.

The book is a compilation of recent research results on building construction materials. Brief Review in the Living Environment

Genesis: The Evolution of Biology presents a history of the past two centuries of biology, suitable for use in courses, but of interest more broadly to evolutionary biologists, geneticists, and biomedical scientists, as well as general readers

interested in the history of science. The book covers the early evolutionary biologists-Lamarck, Cuvier, Darwin and Wallace through Mayr and the neodarwinian synthesis, in much the same way as other histories of evolution have done, bringing in also the social implications, the struggles with our religious understanding, and the interweaving of genetics into evolutionary theory. What is novel about Sapp's account is a real integration of the cytological tradition, from Schwann, Boveri, and the other early cell biologists and embryologists, and the coverage of symbiosis, microbial evolutionary phylogenies, and the new understanding of the diversification of life coming from comparative analyses of complete microbial genomes. The book is a history of theories about evolution, genes and organisms from Lamarck and Darwin to the present day. This is the first book on the general history of evolutionary biology to include the history of research and theories about symbiosis in evolution, and first to include research on microbial evolution which were excluded from the classical neo-Darwinian synthesis. Bacterial evolution, and symbiosis in evolution are also excluded from virtually every book on the history of biology.
