The Cereal Rusts, Volume I: Origins, Specificity, Structure, and Physiology presents the historical, evolutionary, taxonomic, structural, genetic, and physiological characteristics of cereal rust fungi and the diseases they cause in cereal crops. The cereal rusts are potentially serious disease threats to cereal crops and have caused widespread losses in wheat, oats, barley, and related crops. This three-part volume brings together in a single reference source the accumulated knowledge, complex, challenging science of cereal rusts. The first chapters of this 16-chapter volume cover the pioneering contributions of early scientists to the knowledge of cereal rusts, the evolution of cereal rusts, and the taxonomy of cereal rust fungi. The

book also examines the specificity of cereal rusts including formae speciales, race specificity, pathogen-host genetics, histology and molecular biology of host parasite specificity, and the genetics of rust fungus populations as reflected by virulence frequency. The text further discusses the structure and physiology aspects; the germination of urediospores and differentiation of infection structures; and the infection under artificial conditions. The ultrastructure of hyphae and urediospores; the development and physiology of teliospores; and the obligate parasitism and axenic culture of rust fungi are also explained. This volume also encompasses the structure and physiology of haustoria; structural and physiological alterations in susceptible hosts; and effects of rust on plant development in relation to nutrient translocation. Cereal rust investigators, plant pathologists, agronomists, agriculturalists, research biochemists, cytologists, geneticists, physiologists, taxonomists, epidemiologists, and pathologists will find this book invaluable.

Predicting the potential behavior and effects of wildland fire is an essential task in fire management. Mathematical surface fire behavior and fire effects models and prediction systems are driven in part by fuelbed inputs such as load, bulk density, fuel particle size, heat content, and moisture of extinction. To facilitate use in models and systems, fuelbed inputs have been formulated into fuel models. A fuel model is a set of fuelbed inputs needed by a particular fire behavior or fire effects model. Different kinds of fuel models are used in fire science; this document addresses only fire behavior fuel models for use in the Rothermel (1972) surface fire spread model.

In the popular imagination, shamans and drums go together like bread and butter. No-one knows the historical origin of drums, but they have certainly been made and played by people for thousands of years. Part of the way animal skins are prepared for eventual use as clothing or other things, is to stretch them on a frame so they dry flat, and if you tap such a skin drying on its frame, it sounds like a drum. I suspect these drying skins were probably the first drums ever made, and eventually the stretching frame became the drum frame. It is now fairly-well known that the word shaman comes from Siberia, and it is in this vast geographical area that shamanism proper is still to be found. Nowadays the word 'shamanism' has become a rather general word, applied to all sorts of practices - many of which are unrelated to the word's original meaning. Alongside this, many of the spiritual practices of the world's 'first-nations' have also become labeled as 'shamanic,' although some anthropologists do not consider real shamanism to be found anywhere outside of Siberia. But if we allow a much wider definition of shamanism, and say that many forms of shamanic spirituality occur across the planet, we would still have to admit that many of them do not use drums at all in their shamanism, and those that do, don't use them like the shamans of Central Asia and Siberia, as these people have an unique understanding of the sacred role of

the spirit of the drum. Indeed, the drum is so important to Siberian shamanism, that beginning in 1929 the Soviet clamp-down on shamanism - and the turning of shamans from figures of social importance to 'enemies of the people, ' was achieved largely by the destruction or confiscation of their drums. The same thing was done to the Sami shamans of Finland by the Christian Lutheran Church in the previous century. The Church had a habit of burning the drums, although a few - together with some of the Siberian drums taken by the Communists - were kept and put into museums. All the drums used in Siberian shamanism are the type known as 'frame drums.' A frame drum is made by stretching an animal skin over a frame of wood. This frame is generally made from a long thin strip of wood, bent into a rough circle - the two ends of the plank being joined together in some way to keep the hoop closed and firmly fixed. However, wood does not have to be the only material for drum frames. A traditional shaman's drum from Manchuria in Northern China has a thin metal frame with metal jingles attached to it. But whether of metal, or wood, or even plastic - as found on some modern drums - these type of drums are all known as frame drums. Frame drums occur all over the world, from the shaman's drums of Siberia, to the bodhran of Ireland, the bendir of North Africa and the daf of Persia. They are probably the oldest form of drum on earth. Frame drums like this also occur amongst the native peoples of America. - no doubt related to the shamanic drums of their ancestral homelands on the steppes of Central Asia, where the people lived before they migrated across the land bridge that once connected the two continents. However the 'medicine' drums of North

America do not have the same degree of sacred lore as their Siberian cousins have.

This early work by Arthur Conan Doyle was originally published in 1893 and we are now republishing it with a brand new introductory biography. Arthur Conan Doyle was born in Edinburgh, Scotland, in 1859. It was between 1876 and 1881, while studying medicine at the University of Edinburgh, that he began writing short stories, and his first piece was published in Chambers's Edinburgh Journal before he was 20. In 1887, Conan Doyle's first significant work, *A Study in Scarlet*, appeared in Beeton's Christmas Annual. It featured the first appearance of detective Sherlock Holmes, the protagonist who was to eventually make Conan Doyle's reputation. A prolific writer, Conan Doyle continued to produce a range of fictional works over the following years. We are republishing these classic works in affordable, high quality, modern editions, using the original text and artwork.

Limnological research on saline lakes is practiced by a growing cadre of scientists active worldwide in a diversity of disciplines. Every three years since 1979, an international symposium on inland saline waters has served to strengthen and expand the scope of the studies. Promising areas for further research especially well suited to saline lakes include the comparative physiology of adaptation to osmotic stresses, the role of microbial and protozoan communities in nutrient dynamics and biotic interactions in ecosystems with few species. The Third International Symposium on Inland Saline Lakes was held at the University of

Nairobi, Nairobi, Kenya, under the auspices of the Societas Internationalis Limnologiae (SIL). The symposium was sponsored by and received financial or other support from the U.S. National Science Foundation (International Program), United Nations Environment Program, University of California, Santa Barbara, and University of Nairobi. The proceedings occurred for three days (28-31 August, 1985) and were attended by 33 scientists from 14 countries (see list of Participants). On the day prior to the first formal session an afternoon trip to Lake Magadi and salt works was held. The tribulations of this excursion served to acquaint the participants with each other and with the realities of exploring the African bush. A three day post-congress expedition to the rift valley included visits to spectacular saline lakes such as Nakuru and Bogoria. Much of the meeting's and excursion's success is owed to the efforts of the local organizer, Dr. Stephen G.

India's history and culture is ancient and dynamic, spanning back to the beginning of human civilization. Beginning with a mysterious culture along the Indus River and in farming communities in the southern lands of India, the history of India is punctuated by constant integration with migrating peoples and with the diverse cultures that surround the country. Placed in the center of Asia, history in India is a crossroads of cultures from China to Europe, as well as the most significant Asian connection with the cultures of Africa. The Historical Dictionary of Ancient India provides information ranging from the earliest Paleolithic cultures in the Indian subcontinent to 1000 CE. The ancient history of this country is related in this book through a chronology, an introductory essay, a bibliography, and hundreds of cross-referenced dictionary entries on rulers, bureaucrats, ancient societies, religion, gods, and philosophical ideas.

### **The Environmental Geochemistry of Mineral Deposits**

All the solid fuels fossil energy and mineral commodities we use come out of the Earth. Modern society is increasingly dependent on mineral and fossil energy sources. They differ in availability, cost of production, and geographical distribution. Even if solid fuels, fossil energy resources and mineral commodities are non-renewable, the extracted metals can to a large extent be recycled and used again and again. Although the stock of these secondary resources and their use increases, the world still needs and will continue to need primary mineral resources for the foreseeable future. Growing demands have begun to restrict availability of these resources. The Earth is not running out of critical mineral resources - at least for the near future - but the ability to explore and extract

these resources is being restricted in many regions by competing land use, as well as political and environmental issues. Extraction of natural resources requires a clear focus on sustainable development, involving economic, environmental and socio-cultural aspects. Although we do not know what the most important resources will be in 100 years from now, we can be quite certain that society will still need energy and a wide range of raw materials. These resources will include oil and gas, coal, uranium, thorium, geothermal, metallic minerals, industrial and specialty minerals, including cement, raw materials, rare-earth elements. A global approach for assessing the magnitude and future availability of these resources is called for – an approach that, with appropriate international collaboration, was started within the triennium of the International Year of Planet Earth. Some global mineral resource assessments, involving inter-governmental collaboration, have already been initiated. The International Year of Planet Earth helped to focus attention on how the geosciences can generate prosperity locally and globally, as well as sustainability issues in both developed and developing countries.

An unfortunate by-product of industrialization is the contamination of soil and water resources with toxic metals, which becomes an environmental concern when the concentration in soils begins to affect human health. Current remediation methods applicable to contaminated soils are expensive and environmentally invasive since they are based primarily on civil-engineering techniques. This book represents an overview of efforts in exploiting biological and chemical processes to reduce the inherent risk associated with metal-contaminated soils. It presents a comprehensive, up-to-date analysis of in situ immobilization and inactivation of toxic metals by means of plants, microorganisms and invertebrates.

A graphic novel about the Brontë siblings, and the strange and marvelous imaginary worlds they invented during their childhood Glass Town is an original graphic novel by Isabel Greenberg that encompasses the eccentric childhoods of the four Brontë children—Charlotte, Branwell, Emily, and Anne. The story begins in 1825, with the deaths of Maria and Elizabeth, the eldest siblings. It is in response to this loss that the four remaining Brontë children set pen to paper and created the fictional world that became known as Glass Town. This world and its cast of characters would come to be the Brontës' escape from the realities of their lives. Within Glass Town the siblings experienced love, friendship, war, triumph, and heartbreak. Through a combination of quotes from the stories originally penned by the Brontës, biographical information about them, and Greenberg's vivid comic book illustrations, readers will find themselves enraptured by this fascinating imaginary world.

In The Dawn of Queen City athletic time, what would become known all over Ohio as 'The Pit' was exactly that -- a dusty cow pasture on Cincinnati's West Side adorned with a manhole on the 50-yard line. It was the only known playing field in Ohio where a manhole was the home field advantage, and its sewer-lid icon became a kind of trademark for the school's rough-and-ready working-class play. From that inauspicious beginning nearly eighty years ago was born one of the Midwest's most storied prep traditions: Elder High School athletics. In its steady procession of stellar teams and athletes, Elder became a West Side phenomena. Along the way, this all-boys parochial school, nestled in a residential corner of blue-

collar Price Hill, acquired a following of loyalists found in no other school in Cincinnati, maybe in no other school anywhere. This is the mystique that created back-to-back basketball state titles, a cross country dynasty, an un-precedented eleven baseball championships, and a football team with a national ranking. Its football field was named by USA Today as one of the best places in America to watch high school football, and its graduates have populated programs from Division I all the way to the professional ranks. With over 250 photographs, The Pride of Price Hill is, finally, a story about an old-fashioned neighborhood -- a neighborhood most of us wish we inhabited. Over 400 photographs.
