Research Methods and Statistics in Psychology

This text displays the authors' commitment to ensuring that the student has a thorough understanding of the research process from the very beginning. Using contemporary examples from primary sources, RESEARCH METHODS IN PSYCHOLOGY, Seventh Edition encourages students to become engaged in the basics of scientific investigation through an example-based approach. This highly readable text avoids the heavy statistical tone that some introductory students find difficult to understand. Rather, RESEARCH METHODS IN PSYCHOLOGY is conceptually driven to offer students a big picture view of the experimental approach to research. Empirical examples and applications are consistently used throughout to foster critical thinking skills. In many chapters, a unifying empirical example at the beginning of the chapter is cited throughout the chapter to help clarify terms or design problems. By presenting concepts with concrete examples, the text aids students in applying related ideas to their areas of research interest.

This Third Edition of this bestselling text retains its status as one of the most accessible, practically useful and theoretically rigorous textbooks on the market today, and has been developed even further to help students get the most from their studies. The textbook is now oriented around three parts focusing on the major processes in conducting research—from formulating research questions, designing research activity, data gathering, and analysis. A rich diversity of methods is now covered, and the book offers extended coverage of qualitative methods—now fundamental in psychological methods courses.

Psychologists use a variety of research methods and tools to learn about behavior and mental processes. The goal of this book is to introduce students to the “multimethod approach” to research in psychology, including observational, survey, and experimental methods. Students learn the strengths and weaknesses of each method, as well as ethical dilemmas when using them, so that they can become competent practitioners and thoughtful consumers of psychological research. Our approach is to engage students in the research process by

describing contemporary research in psychology. Students learn about recent topics such as online dating and Facebook, cross-cultural observations of helping behavior, PTSD in orphaned chimpanzees, Medicaid and Medicare health outcomes, decision-making during Hurricane Katrina, clinical research and DSM-5, and much more. Each chapter's "stretching exercises," "stat tips," review questions, and challenge questions develop students' critical thinking about the psychological research that appears in scientific journals and in popular media. Together with the companion Online Learning Center for students, the 10th edition of Research Methods in Psychology provides a clearly written, compelling introduction to research methods in psychology

APA Handbook of Research Methods in Psychology

Using a series of over 40 case studies, this valuable text illustrates the processes and pitfalls involved in evaluating psychological research. Invites students to consider whether the conclusion drawn at the end of each case is correct, or whether the results could have an alternative explanation. Cross-referencing between sections is made easy by page references that link the case studies and explanations. Cases reflect the range of research methods taught at undergraduate level and include qualitative research. Gives students an understanding of methodological problems. Equips students to critically evaluate published research. The author and publishers have made every effort to be fair to

the authors of the research described in this book. Like all sciences, psychology is forged in the fire of criticism and refinement, and we hope that the original researchers will understand that any criticism is made with the utmost respect. If you are an author of one of the pieces of research mentioned in the book and would like to respond to the critique presented, please e-mail your comments to Andrew McAleer at Andrew.McAleer@oxon.blackwellpublishing.com.

"Psychology, like most other sciences, has its own set of tools to investigate the important research questions of its field. Unlike other sciences, psychology is a relatively new field with methods and practices that are evolving at a rapid rate. With this textbook, we introduce students to the fundamental principles of what it is like to think like a psychology researcher. We also hope to connect with the Canadian audience to show them the fantastic research being generated in Canada as well as provide them with an accurate picture of the Canadian context for ethical human research. This textbook is an adaptation of one written by Paul C. Price (California State University, Fresno). The first Canadian edition (published in 2013) was authored by Rajiv S. Jhangiani (Kwantlen Polytechnic University). This second Canadian edition was co-authored by Rajiv S. Jhangiani (Kwantlen Polytechnic University) and I-Chant A.
